

**MEV** 

# High Performance Milling

New Generation of High Performance, Economical, Multi-functional Milling Cutters

Newly Developed Triangle Inserts Provide Numerous Solutions to Machining Challenges

High Performance - Low cutting forces and Higher Rigidity for Excellent Chatter Resistance Economical - Longer Insert and Holder Tool Life Multi-functional - Can be Used in Shouldering, Slotting, and Ramping Applications

New Triangular Insert Design

## **High Performance Milling**

MEV

Newly Developed Triangular Inserts for Provide Low Cutting Forces and Increased Rigidity High Performance, Economical, and Multi-functional Milling Solutions

# 1

# High Performance: Low Cutting Force and High Rigidity

Newly developed vertical triangle inserts with 3 cutting edges Achieve stable machining with reduced chattering

#### MEV vs Competitor

# High Performance

The MEV's large A.R. produces lower cutting forces and the vertical triangle inserts provide a higher rigidity.

The great performance of the multi-purpose MEV triangle inserts combines both advantages of conventional positive and negative type inserts.

# Keeping A.R. max. at +17°, provides lower cutting force than the positive insert types of competitors

Cutting Force Comparison (Internal evaluation)

Cutting conditions : Vc = 200 m/min, ap  $\times$  ae = 3  $\times$  18 mm, fz = 0.10 mm/t, ø20 (3 inserts), Dry Workpiece : SCM440  $\oplus$ 

# Low cutting force and large optimal web thickness provides excellent chattering resistance

Chattering Resistance Comparison (Internal evaluation)

Cutting conditions : Vc = 200 m/min, ap × ae = 3 × 18 mm, fz = 0.10 mm/t, ø20 (3 inserts), Dry Workpiece : SCM440 (9)

Slotting

Cutting conditions : Vc = 220 m/min, ap = 3 mm (Slotting), fz = 0.10 mm/t, ø20 (3 inserts), Dry Workpiece : SCM440 (H)

# Provides excellent surface finish and superior cutting accuracy of the wall

Surface Finish Comparison (Internal evaluation)

Cutting conditions : Vc = 180 m/min, ap  $\times$  ae=3  $\times$  40mm, fz = 0.1 mm/t, ø50 (5 inserts), Dry Workpiece : S50C

Cutting conditions : Vc = 200 m/min, ap  $\times$  ae=3  $\times$  10mm (4 pass), fz = 0.15 mm/t, ø50 (5 inserts), Dry Workpiece : S50C

\*Accuracy of the wall surface varies depending on cutting conditions, machining environment, and insert combination.

# The Economical Choice: Lengthened Insert Life with 3 Usable Cutting Edges

#### Insert

#### Unique triangle inserts with 3 cutting edges

PR15 series utilizes excellent MEGACOAT NANO coating technology with wear and adhesion resistance

Achieve long tool life with the combination of a tough substrate and a special Nano coating layer

**Economical** 

Stable Machining with Excellent Wear Resistance

### Toolholder

Multi-functional

Engineered with state-of-the-art simulation and analysis technology, the MEV is built to reduce cutting stress on the cutter body Increased hardness and wide contact surface for improved durability

Improved toolholder toughness and durability

3

#### Long Tool Life with Excellent Wear Resistance

#### Wear Resistance Comparison (Internal evaluation)

Cutting Edge (After machining 14 min)

Cutting conditions : Vc = 180 m/min, ap × ae = 3 × 10 mm, fz = 0.1 mm/t, ø20, Dry Workpiece : SKD11 (30~35HS)

#### Improved Stability with Superior Fracture Resistance

Multi-functional: The MEV can perform a wide variety of machining processes

#### Great performance in shouldering, slotting, and ramping applications (D.O.C. 6 mm or less)

Chip Example (Slotting)

3

Cutting conditions : Vc = 150 m/min, ap = 6 mm (Slotting) fz = 0.2 mm/t,  $\phi$ 20 (3 insert), Dry Workpice : SS400

Good chip evacuation with a unique insert chipbreaker design

Stable machining in applications like slotting and ramping where chip recutting issues are common

Caution with Max. Revolution •: Standard Stock																

Set the number of revolutions per minute within the recommended cutting speed specified by the workpiece on page P9. Do not use the end mill or cutter at the maximum revolution or higher since the centrifugal force may cause inserts and parts to scatter even under no load. Coat anti-seize compound thinly on portion of taper and thread prior to installation.

	Titanium Alloy	0.08 - <b>0.12</b> - 0.15	★ 40 - <b>60</b> - 80		_

The number in **bold font** is recommended starting conditions. Adjust the cutting speed and the feed rate within the above conditions according to the actual machining situation. Set the cutting speed and feed rate for wet machining to 70% in the table above. For high-speed machining, set the feed rate in the table above to 70% (When the cutting speed increases more than the center value of the recommended condition). Cutting with coolant is recommended for Precipitation Hardening Stainless Steel, Ni-base Heat Resistant Alloy and Titanium Alloy.

Cutting with coolant is recommended for finishing. Regularly changing the clamp screw is recommended. This is because the clamp screw may be damaged by long-term use or machining under high cutting conditions as shown in the table above.

# **Ramping Reference Data**

Description	Cutter Dia. DC (mm)	20	22	25	28	30	32	40	50	63~
MEV06	Max. Ramping Angle RMPX	1.00°	0.80°	0.65°	0.60°	0.55°	0.50°	0.40°	0.30°	Not
IVIE V06	tan RMPX	0.017	0.014	0.011	0.010	0.010	0.009	0.007	0.005	recommended

• Make ramping angle smaller if chips are too long.

# **Ramping Tips**

 $\bullet$  Ramping angle should be under  $\alpha$  max (maximum ramping angle) in the above cutting conditions.

• Reduce recommended feed rate in cutting conditions less than 70%.

Formula for Max. Cutting	1 -	ар
Length (L) at Max. Ramping Angle	L - '	tan RMPX

• For two-way ramping, the ramping angle should be half of RMPX.

## **Helical Milling Tips**

For helical milling, use between min. drilling dia. and max. drilling dia.

For helical milling, use between min. drilling dia. and max. drilling dia. Keep machine depth (h) per rotation less than max. ap (S) in the cutter dimensions chart. Use caution to eliminate incidences caused by producing long chips. Cutter dia. ø63 and above are not recommended for helical milling.

# **Drilling Tips**

		Unit : mm
Description	Max. Drilling Depth Pd	Min. Cutting Length X for Flat Bottom Surface
MEV06	0.25	DC-3

It is recommended to reduce feed by 25% of recommendation until the center core is removed when traversing after drilling.

Axial feed rate recommendation per revolution is f < 0.1mm/rev.
